In this study we explore the impact of COVID-19 on the psychological wellbeing of healthcare trainees, and the perceived value of a digital support package to mitigate the psychological impacts of the pandemic.

**RESULTS**
This is research in progress. Data are currently being analysed. Early analysis indicates that interviews generated 3 over-arching themes, and 11 sub-themes. Participants raised significant impacts of COVID-19 on wellbeing, placement experiences, transition to remote learning, and personal circumstances (peers, family, relationships, health). Trainees communicated positive views towards the package as a mechanism for support.

**CONCLUSION**
This study provides insight into the impacts of COVID-19 on healthcare trainees, and the perceived value of an established e-learning package tool to augment psychological support provisions for healthcare students, during and after the COVID-19 pandemic.
